- Easy installation and commissioning
- Accessories and special models available

optoNCDT ILR 1191 sensors are opto-electronic sensors for non-contact distance and speed measurement in industrial applications. The sensor is designed for very large measuring ranges, with and without reflector. Due to the very high measuring rate of the sensor, moving objects can be measured easily. The sensor operates according to the laser pulse time-of-flight principle and is therefore particularly well suited to applications with large distances. Commissioning of the sensor is straightforward due to a variety of interfaces and easy installation options. For outdoor use, the optoNCDT ILR 1191 is equipped with integral heating and protected to IP67.

Applications

Position measurement on gantry cranes
Gantry cranes require multiple measurement tasks: Positioning of the trolley, detection and dimensioning of containers and monitoring of the minimum clearance between the cranes. The ILR1191 with a very large measuring range and low response time is designed for these measurement tasks.

Crash test speed measurement
At acceleration of cars during crash tests, an ILR1191 measures the impact speed and deformation of the test vehicle.

Filling level measurement in silos
Depending on the required accuracy, laser distance sensors determine the filling level of silos at up to four points. Based on these distances, the filling level is calculated.

Acquisition of coil diameters
The quantity of steel wound on and off is monitored via the acquisition of coil diameters using laser probes.
